                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence encodes the DNAX Interferon-like receptor subunit 2 (DIRS2) of the invention. The invention also relates to the DIRS2 protein sequence. The DIRS1 and DIRS2 sequences are subunits of receptors related to cytokine receptors. The isolated receptor gene provides means to generate an economical source of the receptor, allow expression of more receptors on a cell leading to increased assay sensitivity, promote characterisation of various receptor subtypes and variants, and allow correlation of activity with receptor structures. The invention should contribute to new therapies for degenerative and abnormal conditions that the contribute to new therapies for degenerative and abnormal conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DЬ
The invention relates to the isolation of genes AAF23894-F23935 encoding 42 human secreted proteins AAB59465-B59506. The genes can be used to generate fusion proteins by liking to the gene for the human immunoglobulin G Fc portion (SEQIDI) for increasing the stability of the fusion protein as compared to the human protein only. The genes and proteins are useful for preventing, ameliorating or treating medical
                                                                                                                             Claim 1; Page 414-415; 440pp; English.
                                                                                                                                                              Nucleic acids encoding 42 human secreted polypeptides, useful for preventing, diagnosing and/or treating immune, hyperproliferative cardiovascular and neurological disorders or infectious diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Homo sapiens.

The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, be marrow, breast, gastrointestinal tract, liver, or urogenital;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1012 ctccattctgcctgggtgacaatgccttggtttcaacactatcggaatgtgactgtcggg 1071

Isolated cDNA clones contained a common 1.1 kb insert, which was isolated and used to probe a mouse lambda-gtll cDNA library. A positive clone (lambda-.C19) was isolated which contained a 1283 bp EcoRI insert

derived from many of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias concerns the production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

e.g. cardiovascular disease, hypertension, cardiac arrhythmias and
         The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system
                                                                                                                                                     Claim 1; SEQ ID No 866; 530pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                 Match

CDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-stranded cDNA was digested with NotI and cloned into the NotI and Eco RV sites of the pcMVSPORT 6 vector. Library was constructed by Life Technologies. Contact: Feng Liang Life Technologies, a division of Invitrogen 9800 Medical Center Drive Rockvil, Maryland 20850, USA Fax: (1) 301 610 8371 Email:
